This article is about creating a program with Java so that different users could store different files in the same folder. This example shows how this can be accomplished. It also shows that if a folder is shared between multiple computers, the same program can be used to copy that folder into a different folder on another computer. Preparing the Sample Files and Variables: The following files are used in this example. Copy example.jar (with the JAR extension) to the folder where the folder to be shared resides. Copy example2.jar into that folder as well. example.jar is a simple Java archive with three classes: The SharedFolder.java class is the top-level class. The two other classes are subclasses of this class. The DesktopExample.java class is intended to be the only class that will reside in the shared folder. Copy the examples.txt and

javadoc.html files into the folder where the example will reside. Compile the examples.txt and javadoc.html files by executing the following in the command prompt window: Compile the example.jar file: C:\JavaSource>jar cvfm example.jar example\ com\example\DesktopExample

Copy the shared folders into the target folder: C:\JavaSource>move example\DesktopExample.jar C:\JavaSource>move example\DesktopExample.class C:\JavaSource>copy example\\*.xml Next, compile the example2.jar file: C:\JavaSource>jar cvfm example2.jar example\ com\example\DesktopExample Execute this command to copy the shared folder to the target folder, which is named SharedFolder: The code for a shared folder is complex. The only way to access the properties of a file object created by the SharedFolder class is to store the file itself inside the shared folder. This is necessary because an object of the file class cannot be stored in a shared folder. You can see here a very simple example where the shared folder is stored inside the shared folder. However, this is not a convenient implementation. The real shared folder should contain a folder object and a sub-folder object instead of storing a file object in the sub-folder. Only the top-level folder object should be accessible from outside the shared folder. Realistically, a single folder is a69d392a70
