You may find the Photoshop tutorials that follow beneficial for those new to Adobe Photoshop and trying to get their work polished. For more advanced users, the tutorials may seem too basic. Folks who are ready to dive in and learn Photoshop fully can find the tutorials that follow much more helpful. Using Photoshop Photoshop opens with the Welcome screen, shown in Figure 12-1. Click the Photoshop button to begin the application. The default (desktop) setting is Classic, which has a flat view of all the layers in your image. This setting is best for capturing an image and then inspecting the various layers to tweak them individually. When working on a large image, many layers are displayed at once. In this setting, you click the window tabs or the Layout bar to change the properties of the panels and tools. Figure 12-1: You open Photoshop with the Welcome screen. Layers, Paths, Channels, and Actions The Layers panel (refer to Figure 12-1) houses the various layers you have placed in your image, as well as those you create in the image editor. With the Layers panel, you can add new layers at any point in the project, and all the layers you have created appear in the thumbnail of your image in the Layers panel. By default, the layer in the image is the active layer. You can switch layers to the inactive layers using the drop-down menu just to the right of the layer thumbnail. This makes it easier to work with a layer if you don't want to work with it. If you can't see a specific layer in the Layers panel, you can click the arrow next to the layer thumbnail to open the Layer drop-down menu, and then select the layer you want to work on. If you don't see the menu, click the Layer button in the upper-right corner of the Layers panel. The Paths panel allows you to create nested paths that can be filled, stroked, or cut. The paths are useful for creating outlines or other shapes on your image. The Paths panel is located to the right of the Layers panel. The Channel palette provides access to the various channels in your image. You can use Channels to apply adjustments, such as Levels, Curves, and brightness, to the information stored in the channel. The Channels panel is located to the right of the Paths panel. The Actions panel enables

News Former Monroe County Executive Dennis Toomey has filed a Notice of Appeal in the Court of Appeals seeking to overturn a decision by a Federal Grand Jury. A press release issued by the court says the appeal will focus on three issues: The Constitutional claim that the Legislature has interfered with the Executive's power to veto legislation. This Court ruled that the Legislature had not interfered with the Executive's power to veto legislation. It is the Executive's position, based on the principle of separation of powers, that the Legislature cannot constitutionally involve itself in the Executive's discretionary veto process. The Constitution specifically vests the Executive with the power of the veto. The case law related to whether the "Sunshine Law," which is not a statute or order but rather a policy of the Department of State, provides adequate procedures and safeguards for the public to obtain discovery of documents. The court ruled that the Sunshine Law sufficiently provided for the public to obtain discovery. The bill's exclusion of the workers' right to a "fair wage" and failure to provide for employee benefits. The court ruled that the Workers' Right to a "fair wage" is not constitutionally guaranteed and that the failure to include a provision for employee benefits was not unconstitutional. Toomey's appeal was filed on May 3, 2019, and a hearing is scheduled for September 24, 2019. A trial court decision in favor of the Grand Jury would limit the Governor to only three options: signing the bill into law; vetoing the bill without taking any action; or vetoing the bill and then forcing a special session of the Legislature to override his veto. If he vetoed the bill and did not call a special session, the Legislature would have to deal with the bill. On Thursday evening, the White House announced President Trump will sign an executive order to keep open "as many as 20" federal agencies that have been hit with a so-called furlough or government shutdown. That's because the order will allow them to "reprogram" money from other federal accounts to cover any remaining costs, according to the report. During Thursday's announcement, White House press secretary Sean Spicer said the executive order will authorize agencies to "take steps to reallocate" funds from other departments. Under the order, agencies can request specific funds. The White House did not specify

The effect of macro- and micropatterning of collagen on the osteoblast phenotype in tissue-engineered bone: A study with mouse preosteoblasts. The use of tissue engineering (TE) to engineer bone implants requires defined microenvironments and molecular control over the biochemistry of cell differentiation. In this study we sought to investigate the effect of substrate micropatterning on the differentiation of preosteoblasts into osteoblasts. We employed a cell-repellent polymer, poly(ethylene glycol)-succinyl (PEG-SA) to pattern collagen, and macroscale structures, such as microgrooves and 3D-printed scaffolds, were also incorporated into the matrix. The influence of these different features on the phenotype of preosteoblasts was assessed by examining the expression of cell differentiation markers, the production of extracellular matrix molecules, and cell spreading. The results show that PEG-SA gives rise to well-defined micropatterns of collagen, which are resistant to protein adsorption. The unique geometry of the collagen-patterned substrates and 3D-printed scaffolds directs a distinct 3D microenvironment, which supports preosteoblast differentiation. Q: Would a buck converter with XA series inductors be suitable for a 4 phase application with adjustable speed? I am doing a research project on an adjustable speed wind turbine that I'm working on. I am using some Control Techniques to slow down the torque production to reduce power loss and increase the energy efficiency of the mechanical braking system. I am using a 4 phase induction motor, but if I use an adjustable speed motor, I will have it in only 3 phases for most of the time. There is a 4 phase bridge that I use to drive the induction motor at the same time. Right now I am using a current-in-phase (CI) converter to drive the bridge from a power company that is either at 3 phase or single phase. When I want to drive the bridge at a higher speed, I can switch to phase shift (PS) converter. I'm currently thinking of using the XA series inductors from the PicoScope 335 series PicoScope to use in an off-grid renewable energy application. However, my first step is to try and make the system work with the 3 phase CI converter. I am wondering if I will get some sort of power factor correction in the CI converter with
